## Recovering Predictor–Criterion Relations Using Covariate-Informed Factor Score Estimates

Patrick J. Curran,  Veronica T. Cole, Daniel J. Bauer, W. Andrew Rothenberg, and Andrea M. Hussong   
*University of North Carolina at Chapel Hill*

The data-generating and fitted models are defined in Equations 1 through 8 in the manuscript. The cell means are organized by sample size, number of items, magnitude of DIF, and proportion of DIF. The tables are organized by outcome (1, 2 and 3) and predictor within outcome (intercept, score estimate, etc.; see equations in text of paper for predictor order for each outcome). Column headings are defined as:

<b>SampleSize</b>	sample size	three levels: 500, 1000, 2000
<b>NumItems</b>	number of items	three levels: 6, 12, and 24
<b>DIFMag</b>	magnitude of DIF	two levels: small and large
<b>DIFPerc</b>	proportion of DIF	two levels: 1/3rd and 2/3rds of item set
<b>LMSV</b>	magnitude of impact	large mean/small variance
<b>MMMV</b>	magnitude of impact	medium mean/medium variance
<b>SMLV</b>	magnitude of impact	small mean/large variance

The underscore notation denotes type of score estimate:

<b>_1</b>	true scores
<b>_2</b>	unconditional (or IRT) scores
<b>_3</b>	impact-only scores
<b>_4</b>	impact-DIF scores

For example, column **MMMV\_3** represents medium mean/medium variance impact for impact-only scores. All relevant details about score estimation and model fitting are presented in the manuscript.

Please contact Patrick Curran and [curran@unc.edu](mailto:curran@unc.edu) if you have any questions.
